

ABSTRACT OF THE DISCLOSURE

A system and method includes a retrieving unit dynamically retrieving one or more points from a database, wherein the points are one of telephone numbers, cable numbers, and IP address numbers. A group of points mapping unit dynamically maps the one or more points to one or more groups of points and dynamically orders each group of points to a calling group of points and a receiving group of points. A zone creator unit dynamically identifies the one or more groups of points having same calling areas and dynamically generates therefrom one or more local zones. An assignment unit dynamically assigns an identifier to each calling group of points and each receiving group of points in each local zone. A rule generator dynamically generates local calling rules by concatenating the identifiers assigned to the calling group of points and to the receiving group of points in each local zone. A data transfer unit transfers the local calling rules to a rule database for billing purposes.
